ANACONDA PRODUCTS

ANACONDA metal products comprise copper and copper alloyed with zinc, tin, nickel, lead, aluminum, silicon, manganese, cadmium and beryllium in all combinations that can be wrought into the following forms:

Angles
Anodes
Architectural Shapes
Blanks
Brazing Solder
Burs
Cast Bronze Fittings
Channels
Circles
Commutator Bars
Condenser Head Plates
Condenser Tubes
Continuous Hinge Strips
Copper Tubes for Plumbing, Heating and Gas Lines
Die Castings
Die Pressed Forgings
Drawn Shapes
Electrical Wire and Cable
Electro-Deposited Thin Sheet Copper
Everdur Electrical Conduit
Electrical Metallic Tubing
Rigid Conduit
Extruded Shapes
Fancy Pattern Seamless Tubes
Fancy Pattern Sheet Metal
Forging Blanks
Heat Exchanger Tubes
Ingots
Large Diameter Tubes
Open Seam Tubes
Pipe
Platers' Bars and Cores
Plates
Pressure Die Castings
Printers' Rules
Printing Rollers
Projectile Bands
Rivets
Rods
Rolled Shapes
Rolls
Seamless Tubes
Segments
Sheet Metal Mouldings
Sheets
Shells
Small Diameter Tubes
Strips
Terrazzo Strips
Through-Wall Flashings
Tubes for Dry Cans
Turbine Blading
Welding Rods
Wire

Standard Anaconda Metals are listed on the following page

THE AMERICAN BRASS COMPANY

ANACONDA METALS

Admiralty	Economy Bronze
Ambraloy	Everdur*
Ambrac*	Forging Bronze
Architectural Bronze	Hardware Bronze
Avialite* Bronze	Jewelry Bronze
Benedict Nickel	Manganese Bronze
Beryllium Copper	Muntz Metal
Brass (Red)	Naval Brass
Brass (Yellow)	Nickel Silver
Brazing Metal	Phosphor Bronze
Bushing Bronze	Silicon Copper
Commercial Bronze	Super-Nickel
Copper	Tempaloy*
Cupro Nickel	Tobin Bronze*

Technical Service

No one metal can satisfy every requirement. Wherever metal is used, such problems as corrosion, ductility, conductivity, fatigue, strength and abrasion are encountered, and while copper alloys, in general, can be used to meet these requirements, maximum results can be obtained only by selecting the alloy best suited for a specific purpose. The American Brass Company, having a background of more than a century's metallurgical experience, will gladly co-operate in the solution of individual metal problems.

Base Prices and Schedules of Extras for pricing Anaconda Metals furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA
STANDARD AND SPECIAL PRODUCTS

The American Brass Company through its seven large plants with their specialized equipment, is able to satisfy every manufacturing requirement for a copper or copper alloy material. The strategic locations of the mills in the industrial centers of the country are the focal points for economic distribution of non-ferrous metals to consuming manufacturers.

During the past year, The American Brass Company has produced seamless drawn tubes with openings too small to admit the passage of a human hair, as well as the world's largest condenser head plates, huge Muntz Metal semi-circles 126 inches in radius and weighing 9,300 lbs. each. It produces, as a matter of daily routine, alloys for deep drawing and spinning, wire for weaving and for delicate springs, special alloys for cartridge cases and for watch springs, platers' cores and bars with special properties required by jewelry artisans, sheets and shells for pressure vessels, metals which can be machined and cut at high speeds, but will have high physical properties and corrosion resistance, materials in special designs for decorative purposes, rods for welding by either the gas or electric process.

In addition, The American Brass Company produces special alloys and special forms for the use of customers with unusual requirements. Today its Research Department may create a bronze for a ball cage which may require conflicting properties, such as stiffness and high fatigue limit as well as the ability to undergo severe forming operations and to machine without forming burs. Tomorrow, it may be called upon to evolve a casting alloy which will have high tensile strength, ductility and toughness, with excellent machinability. Through its Research and Technical Department, The American Brass Company is constantly solving current metal problems and anticipating future requirements with the development of new metals to meet them.

The following pages contain brief descriptions of the more representative standard Anaconda products. Literature and additional information on any of these products will be furnished upon request.

ANACONDA CONDENSER TUBES

SUPER-NICKEL, AMBRAC*, AMBRALOY, COPPER, ADMIRALTY AND MUNTZ METAL

Anaconda Super-Nickel and Ambrac Tubes are recommended for marine and stationary condensers operating under unusually severe conditions. Actual experience during the past ten years substantiates the conclusions of metallurgists that high nickel alloys provide the best resistance to wear and corrosion and possess the necessary heat conductivity and strength to meet all condenser requirements.

More than 300 vessels are now equipped with high nickel alloy tubes and numerous installations have been made in land stations.

Ambraloy-927 Tubes have given especially good results in certain quarters and, when the user feels that conditions do not warrant the higher price of Super-Nickel or Ambrac, The American Brass Company offers condenser tubes of this alloy for installations where Admiralty Tubes have failed in service because of impingement attack.

Anaconda Super-Nickel, Ambrac, and Ambraloy Condenser Tubes are now produced by an **extrusion, rolled and drawn process** which makes possible a better finish and physical structure in these alloys than is obtainable by either cup drawn, Mannesman or cast shell methods.

Descriptive literature and prices furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA
LARGE DIAMETER
SEAMLESS TUBES AND SHELLS

In order to supply the growing demand for large diameter Seamless Tubes, The American Brass Company has enlarged its equipment for Tube manufacture and is now prepared to furnish Copper and Copper Alloy Tubes and Shells up to 26 in. diameter, and in commercial gauges.

TUBES

Among the various applications where large Tubes have proven satisfactory are Paper Rolls for the manufacture of newsprint and other pulp papers, Pulp Lines, Pump Cylinder Tubes for Gasoline Pumps, Dry Cans, Steam Lines, Expansion Joints for Pipe Lines, Refrigerator Condensers or Coolers, Projectile Bands, Marine installations and similar uses.

SHELLS

A specialty is also made of large size Seamless Copper, Brass and Everdur Shells with one end closed.

In the fabrication of the Shells the closed ends are left much heavier than the sides, having practically the original thickness of the metal of the Circles from which they are formed.

Such Shells are used for the manufacture of Tanks, Range Boilers, Sterilizers, Chemical Stills and a great variety of other purposes.

TOOLS

Tools are available for the manufacture of Tubes and Shells in a large variety of sizes up to 26 in. diameter. Where the quantity involved is sufficient to warrant the cost of new tools, special size Tubes or Shells can be made up to the limit mentioned, provided the gauge is not proportionally too heavy nor too light for the diameter.

Further information and prices furnished upon request.

ANACONDA WELDING RODS

For Oxy-Acetylene and Electric Welding

TOBIN BRONZE*, ANACONDA-520 BRONZE, MANGANESE BRONZE, PHOSPHOR BRONZE, EVERDUR*, SUPER-NICKEL, ELECTROLYTIC COPPER, DEOXIDIZED COPPER, ECONOMY BRONZE, BRAZING METAL

The Oxy-Acetylene and Electric Welding Processes have developed so rapidly that the equipment has become standard in foundries, machine shops, garages, locomotive and machine repair shops and for fabricating all kinds of metal equipment, as well as assembling metal structures.

The American Brass Company, one of the first to realize the importance of this great constructive work, has developed, through exhaustive study and research, a complete line of Anaconda Welding Rods in various alloys, each with its individual characteristics and each particularly adapted to a certain class of work.

Uniform composition and tensile strength of the filler rod are essential to the production of strong welds. Both factors have been carefully studied by The American Brass Company and are rigidly controlled throughout the manufacturing process, resulting in uniformly strong, clean, dense rods—free from impurities, dirt spills and other defects.

The American Brass Company offers the services of its technical staff for the discussion of specific welding problems, and is also prepared to furnish welding rods of special composition to meet unusual requirements or recognized engineering specifications.

Descriptive literature and prices furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA CASTING INGOTS

To provide foundries with casting alloys of uniform composition, The American Brass Company produces ingot metal in seven alloys to meet both engineering and architectural requirements. All Anaconda ingot metal is produced under close metallurgical control to provide exact composition, and is ready for remelting and casting with ordinary brass foundry equipment.

Anaconda casting ingots are furnished in the following alloys and forms:

Benedict Nickel—Cast bars cut into blocks, suitable for charging small crucibles—used chiefly to match wrought Nickel Silver architectural materials.

Ambrac*—20%—In small blocks—used for cast equipment requiring a high strength, high corrosion resistant white material.

Ambrac*—30%—Same form and purposes as Ambrac—20%—possesses higher physical values and corrosion resistance.

Manganese Bronze—In 25-pound notched ingots—used for cast parts requiring resistance to wear and abrasion.

Architectural Metal—In small blocks—used for castings to match the color of wrought architectural bronze materials.

Everdur*-1000—In 25-pound notched ingots—used for engineering equipment castings requiring high strength, high corrosion resistance and weldability.

Tempaloy*—Same form as Everdur. In addition to high strength and unusual resistance to severe corrosion, Tempaloy castings can be heat treated to increase hardness and resistance to abrasion.

Descriptive literature and prices furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA EXTRUDED AND DRAWN SPECIAL SHAPES

Anaconda Special Shapes, produced by the extrusion or drawing processes, are used to a large extent by leading fabricators of ornamental and structural metal work, as well as manufacturers of machinery and mechanical equipment.

EXTRUDED SHAPES

Copper alloys, which can be hot worked, are successfully wrought into intricate finished shapes by extruding through a hardened steel die. Extruded Shapes are characterized by their strong, homogeneous structure, smooth surface and freedom from pits and porosity found in castings. The edges are sharp, and clean, making possible the detailed execution of original designs.

Extruded Shapes are used not only for architectural purposes, but many manufacturers have increased the quality and decreased cost of their products by using these preformed shapes in place of castings or other materials which required considerable machining.

DRAWN SHAPES

Anaconda Drawn Shapes are produced by cold drawing and are available in a wider range of alloys and lighter sections than Extruded Shapes. The physical values of Drawn Shapes are somewhat higher than shapes which are extruded. They are used for essentially the same purposes, the alloy usually being the determining factor.

DIES

The American Brass Company has accumulated thousands of dies for both Extruded and Drawn Shapes, thus saving tool costs in many instances.

Descriptive literature and prices furnished upon request.

ANACONDA
DIE PRESSED METALS

The continued demand from users of small parts made from sand castings for a better product, free from blow-holes and other defects common in castings, has been met by The American Brass Company through the manufacture of hot forged or pressed parts.

To insure the greatest possible density and also the absence of both exterior and interior imperfections, extruded rods are used as the base product, thereby retaining all the good qualities of that material in the pressed parts which are nearly twice as strong as sand castings. They are gas, air and water-tight and will withstand high pressures.

Die Pressed Parts have the advantage of being more uniform in shape and truer to size than sand castings. In most instances, the machining of die pressed parts is unnecessary except for sizing of close fitting parts. Because of their uniform size, die pressed parts can be chucked with little, if any fitting. They machine and thread easily and can be finished at relatively high speeds.

Descriptive literature and prices furnished upon request.

ANACONDA PRESSURE DIE CASTINGS

Because Die Castings have smooth surfaces, uniformity of shape, accurate dimensions and are free from blowholes, they can be used with little, if any, finishing.

Anaconda Pressure Die Castings, which can be cored when necessary, are produced on machines which differ in many ways from the equipment in general use; principally in higher operating pressures which have a marked effect in improving the density as well as the surface of the cast metal.

Pressure Die Castings of exceptional strength are available in a copper rich alloy containing small percentages of silicon and manganese. This metal known as Everdur-1026 is protected by patents owned by The American Brass Company. It has a minimum tensile strength of 85,000 pounds per square inch and a minimum elongation of 8% in 2 inches.

Where a softer metal than brass will meet requirements, zinc alloy castings can be produced which will be stable in warm, humid atmospheres.

Descriptive literature and prices furnished upon request.

ANACONDA RIVETS AND BURS

COPPER, BRASS, BRONZE, EVERDUR* AND NICKEL SILVER

Anaconda Rivets and Burs are accurate to size, uniform in temper and of high purity.

They are manufactured by carefully supervised processes and are packed in attractive boxes, each containing the full specified net weight.

Standard Flat Head Rivets are stamped with the Anaconda Spear Head and all packages are labeled with the Anaconda Trade-mark, a guarantee of quality and dependability.

Flat Head Copper Hose Rivets

Packed with and without burs. Nos. 7 and 8, all lengths from ¼ in. to 1 in.

Oval Head Copper Trunk Rivets

Packed with and without burs. No. 9, all lengths from ¼ in. to 1¾ in. No. 12, all lengths from ¼ in. to ¾ in.

Copper Brake Band Rivets, Countersunk Head

Sizes: Nos. 6 (.203) to 12 (.109), ⅜ in. to 1 in. long over all. Packed in 1 lb. boxes or in bulk weights of 25 lbs. or over.

Copper Belt Rivets

Packed with and without burs. Nos. 4 to 15, all lengths from ¼ in. to 2 in.

Copper Burs Only

No. 3, 5⁄64 in. outside diameter; .290 in. inside diameter; .081 in. thick; and intermediate sizes to No. 16, ¼ in. outside diameter; .067 in. inside diameter; .018 in. thick.

Packing

All the above styles and sizes are supplied in bulk or in boxes containing 8 oz., 12 oz., 1 lb., 4 lbs., or in any other size box to meet customers' requirements.

Standard size Rivets and Burs packed in boxes of uniform or assorted sizes carried in stock for prompt shipment.

Descriptive literature and prices furnished upon request.

*Trade-mark Reg. U. S. Pat. Off.

ANACONDA RIVETS AND BURS

COPPER, BRASS, BRONZE, EVERDUR* AND NICKEL SILVER

Unless otherwise specified all rivets in cartons are shipped in cases containing 100 lbs.

Oval Head Copper Braziers' Rivets

Length measured from under the head

Sizes: From No. 00, 5/32 in. shank and 5/16 in. long to No. 10, 21/32 in. shank and 1 1/4 in. long.

Flat Head Copper Braziers' Rivets

Length measured from under the head

Sizes: From 1/4 in. to 1/2 in. diameter of shank and from 1/2 in. to 2 in. in length.

Both Oval and Flat Head Braziers' Rivets are packed in boxes containing 5 lbs., or in bulk cases containing 100 lbs.

Flat Head Copper and Brass Tinners' Rivets

Sizes: 1/2 lb., 3/4 lb., 1lb., 1 1/4 lbs., 1 1/2 lbs., 2 lbs., 2 1/2 lbs., 3 lbs., 4 lbs. to 6 lbs., to the thousand, packed 1,000 rivets of uniform length per box.

Oval Head Brass Jacket Rivets

Length measured from under the head

Sizes: Nos. 7, 8, 9 and 12, 1/4 in. long. Nos. 8 and 13, 3/16 in. long. Uniform lengths packed in 1 lb. boxes.

Copper or Brass Washers

Supplied in packages or bulk to fit 3/16 in. to 1 in. bolts, inclusive.

Special Copper or Brass Rivets

Tools are maintained for producing Round, Oval, Countersunk and Cone Head Rivets in diameters of 1/8 in. to and including 3/4 in., and lengths of 3/16 in. to and including 4 in., depending on the size of the shank.

A minimum quantity of 25 lbs. is required when filling orders for Special Rivets.

Descriptive literature and prices furnished upon request.

* Trade-mark Reg. U. S. Pat. Off.

ANACONDA ELECTRICAL WIRE AND CABLE

Anaconda Electrical Wire and Cable, manufactured by The American Brass Company, is sold by the Anaconda Wire & Cable Company, 25 Broadway, New York.

Anaconda engineers have contributed many important developments to the electrical industry, not only in the metallurgy of materials but in the design of wires and cables.

It was discovered in the laboratories of The American Brass Company that the element Cadmium could be readily alloyed with Copper to produce bronzes with strength, resistance to wear, and electrical conductivity greater than the Tin-Bronzes previously used. The Cadmium-Bronzes are sold under the trade name Hitenso*.

Calsun Bronze*, a patented alloy of copper, aluminum and tin, is another Anaconda material, developed to supply the need for a non-ferrous metal of high strength to be used for overhead construction, guy and messenger cables, overhead grounds and other applications where unusual structural strength is essential.

Bare Copper Wire and Cable—is made from Anaconda mined and electrolytically refined copper having a purity of not less than 99.9%. Both products conform with every requirement of the American Society for Testing Materials specifications.

Hollow Conductors (Patented)—have been developed to obtain the desired outside diameter in the most efficient manner, eliminating the use of non-conducting steel, hemp or jute materials for fillers.

Anaconda Hollow Conductors are sturdy and economical, and consist of a core made by twisting a copper strip of I-Beam cross section around its longitudinal axis upon which are stranded the wires of the cable either single or in rope lay construction. The web of the core provides a rigid column across the diameter of the cable and the flanges give adequate bearing surface for the wires at short intervals, resulting in a light weight, flexible, cylindrical cable capable of withstanding high compression.

Anaconda Hollow Conductor is efficient and economical for transmission of voltages of 220,000 and above, or of large currents. The large outside diameter effectively reduces corona and a-c. resistance losses, practically eliminating skin effect, and has a higher current-carrying capacity because of its larger surface for radiation of heat.

Descriptive literature and prices furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA ELECTRICAL WIRE AND CABLE

Anaconda Electrical Wire and Cable, manufactured by The American Brass Company, is sold by the Anaconda Wire & Cable Company, 25 Broadway, New York.

Hitenso* "BB" Transmission Wire—A high strength, high conductivity wire for long spans. Developed to meet service requiring great strength with the least possible sacrifice of conductivity.

This wire has a minimum conductivity equal to 85% of hard-drawn copper and 35% greater strength. It is 47% stronger than hard-drawn copper of equivalent conductance. Hitenso "BB" permits the use of small diameters on long spans with consequent reduction of wind and sleet load.

Preformed High Strength Cable—A stranded copper-alloy cable especially suitable for cutting into short lengths. Cuts without unraveling. Serving is not necessary. Used for guying poles, aerial messenger cables and cross-span wires or wherever high resistance to corrosion is required of a high strength cable.

Composite Cable—Consisting of a core of Calsun Bronze* wires surrounded by one or more layers of hard-drawn copper wires, combining into one non-ferrous cable both high strength and high conductivity.

Anaconda Hard Drawn Copper Trolley Wires—Are most economical for normal service conditions where traffic is not heavy. Anaconda Copper Trolley Wire is made from Anaconda mined and refined electrolytic copper and fulfills in every respect the specifications issued by the American Society for Testing Materials and the American Electric Railway Association.

Anaconda Tin Bronze Trolley Wires—Designated "High Strength" and "Medium Strength" are manufactured to meet A.S.T.M. and A.E.R.A. specifications.

Hitenso* Trolley Wires—An exclusive Anaconda product, combining high tensile strength with the least sacrifice in conductivity and the maximum service that can be expected from overhead contact wires.

Other Products—In addition to the above products, manufactured by The American Brass Company, a wide variety of insulated, lead sheathed and otherwise protected wires and cables, is manufactured by the Anaconda Wire & Cable Company.

Descriptive literature and prices furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA
BUS MATERIALS

In addition to a complete line of Copper Bus Bars which are unsurpassed for uniform quality and high conductivity, The American Brass Company produces bus tubes made from specially refined high purity copper billets. These tubes are used for certain installations in place of rectangular copper.

Red Brass Tubes are manufactured for the outside casings of copper bus tube installations surrounded by a dielectric bath of oil. Everdur is supplied for castings and for the bolts which make up the armor clad portion of such bus systems.

The American Brass Company also controls the exclusive rights for constructing hollow ventilated busses from copper rectangular bars, channels or angle shapes, in accordance with the Le Clair Patents together with the sole rights for assembling such copper busses with clamps and supports under the terms and claims of the Bostwick Patent, which rights are available to purchasers of Anaconda Bus Shapes.

Hollow ventilated bus construction provides a solution to many electrical engineering requirements where high voltage, heavy currents and limited space necessitate construction embodying structural strength, and providing low ohmic and reactance loss, and effective heat dissipation. Alternating currents of 2,000 amperes and more are economically carried by hollow busses made of two channel or angle shapes, mounted in rectangular form. Channels are most commonly assembled in pairs placed with webs vertical and sufficiently separated from each other to permit free circulation of air throughout the interior.

Descriptive literature and prices furnished upon request.

ANACONDA
ELECTRICAL CONDUIT
Non-Rusting

Everdur EMT—for use with threadless fittings
Everdur RC—for use with threaded fittings

Everdur Electrical Conduit was developed by The American Brass Company to meet a long felt need for a more durable conduit which would not rust to destruction when in contact with such corroding influences as moisture, dampness, chemicals, etc., prevalent in surrounding air, soil or construction materials.

Everdur Conduit is particularly suitable for public buildings; also for wiring installations in railroad yards and terminals where the conduit might be exposed to smoke fumes; around docks and on shipboard where the action of salt atmosphere is a consideration; in chemical and oil refinery plants; battery rooms; dairies and ice cream plants; subways, mines and underground workings; for viaduct and bridge construction, and other locations where rustable conduit would have a limited life.

Everdur Conduit has been fully tested for conductivity, short circuit and ground, resistance to arcing, electrical bonding, tensile and compressive strength and resistance to impact. Everdur is an alloy composed almost entirely of copper, with small amounts of other materials added to provide great strength and toughness. The advance in price over steel is nominal considering its durability.

Everdur Conduit is trade-marked and both Everdur Electrical Metallic Tubing and Everdur Rigid Conduit are listed and labeled by the Underwriters' Laboratories and have successfully withstood the prescribed tests. EMT and Rigid Conduit are accurately drawn to size for use with standard Everdur fittings now available.

Everdur Conduit is distributed through Electrical Wholesale Supply Houses and Jobbers.

Descriptive literature and prices furnished upon request.

ANACONDA
FANCY PATTERN SHEET METAL

Sheet metal embossed in a variety of standard and ornamental patterns has become a popular product with manufacturers of decorative metal articles.

Former production methods required the embossing of figured ornamentation upon each individual piece after it had been formed, and consequently articles of this character were quite expensive.

To overcome such high production costs, The American Brass Company developed facilities for supplying the basic metal already embossed in a variety of standard patterns and designs. This figured sheet brass, which can be obtained in strips and coils showing a wide variety of patterns, is economically used in the manufacture of jewelry findings, dress trimmings, table-ware, lighting fixtures, house furnishings, toilet accessories, etc.

These embossed patterns can be applied to Copper, Yellow Brass, Red Brass, Commercial Bronze and some grades of Nickel Silver. Special designs can be made to order, provided the quantities required are sufficiently large to warrant the expense of new embossing rolls.

Catalog of standard patterns and price information furnished upon request.

ANACONDA
FANCY PATTERN SEAMLESS TUBES

Anaconda Fancy Pattern Seamless Brass Tubes have been developed by The American Brass Company in a wide variety of designs, shapes and sizes to supply the demand among the metal arts and crafts for ornamental brasses.

Manufacturers of bridge, floor and table lamps, electric lighting fixtures, metal novelties, andirons, coffin hardware, brass bedsteads and similar furnishings use Fancy Pattern Brass Tubes in the fabrication of their products because they provide an economical means of obtaining artistic results.

Through their use, the expense of making and maintaining embossing dies in addition to many manufacturing operations employed in the production of artmetal designs may be eliminated.

All standard brass finishes may be applied to Fancy Pattern Tubes and many unique effects can be produced by combining different designs and shapes.

Catalog of standard patterns and price information furnished upon request.

ANACONDA "ELECTRO-SHEET" COPPER

A recent development by Anaconda metallurgists—the electro-deposition of solid copper—has resulted in the production of copper sheets in very thin gauges, wide widths and practically unlimited lengths, at moderate cost.

"Electro-Sheet" is available in weights of one ounce (.0013 in.) to seven ounces (.0094 in.) per square foot; 1 oz. and 1½ oz. material is furnished in standard widths of 30 in. and 50 in. and 2 oz. to 7 oz. material in standard widths of 30 in. and 40 in., in rolls of unlimited lengths. All the above weights are stocked in Standard Rolls, 30 in. wide, containing 25 ft., 50 ft. and 100 ft. lengths.

A remarkable new development in the form of **Built-Up Copper and Asphalt roofs** has been attained through the use of 2 oz. "Electro-Sheet," 30 in. wide. Outstanding advantages for such roofs are ease of application, smooth appearance and superior durability.

"Electro-Sheet" is also suitable for various other uses including weather-proofing and damp-proofing masonry foundations and cellars, floors, walls and roofs in building construction; termite and vermin proofing wood structures; coverings for walls and ceilings; pipe wrapping; capping wooden piling and power line poles; waterproofing bridge decks; also electrical equipment; shipping containers; novelty stationery and advertising inserts and displays.

"Electro-Sheet" can be bonded readily to canvas, felt, burlap, insulating board, wood, paper, etc., suggesting many practical and useful combinations.

Several of these products have been developed by customers and are now on the market.

Descriptive literature and prices furnished upon request.

ANACONDA
10 OZ. ECONOMY COTTAGE ROOFING

To provide an economical and durable copper roof for small dwellings The American Brass Company has developed Anaconda 10 oz. Economy Cottage Roofing. This product is not intended to compete with the regular 16 oz. copper for general roofing, but to provide a metal roof for the smaller house at a reasonable cost.

Anaconda 10 oz. Economy Cottage Roofing is supplied in the form of strips 16 in. wide by 6 ft. long. By using sheets this width, thus reducing the seam spacing to a scale proportional to the size of a smaller building, thinner metal can be used and still retain the same strength and wind resistance obtained from wider panels of heavier gauge sheets. When these roofing sheets are assembled on the building, the standing seams will be spaced approximately 13 in. apart providing a vertical lined roof of pleasing architectural appearance.

Of all forms of copper roofing, the standing seam type is considered to be the least expensive and provides the greatest freedom from trouble. Such a roof can easily be fabricated by any experienced sheet metal worker and applied practically without solder (except at the flashings) to give free movement for expansion and contraction of the metal and complete protection against the weather.

Anaconda 10 oz. Economy Cottage Roofing strips can be more easily and quickly formed in the shop or on the job than 16 oz. copper. After the panels are formed, they can be installed with regular roofers' tools.

Being made of metal a copper roof reduces the insurance rate as it eliminates the risk of fire from sparks. If a copper roof is correctly grounded, it constitutes one of the most effective forms of protection against lightning.

Copper, more than any other building material, increases in beauty with age and service. Copper roofing reflects quality and aids appreciably in the resale of a house. From an economic standpoint, a standing seam roof requires a minimum of maintenance and should give effective protection against the weather as long as the building stands.

Descriptive literature and prices furnished upon request.

ANACONDA
BRASS AND COPPER PIPE

For use with Threaded Fittings

The American Brass Company manufactures brass and copper pipe in all standard sizes up to and including 10 in. with extra heavy wall thicknesses, and up to and including 12 in. with regular wall thicknesses.

Anaconda Brass Pipe is manufactured in two alloys to meet all water conditions.

Anaconda 67* Brass Pipe can be depended upon to give lasting service in all localities where normal conditions prevail; that is, where the water has a low permanent hardness, a fair degree of temporary hardness or is low in carbonic acid gas content and relatively high in alkalinity. This alloy contains 67% copper, is semi-annealed, seamless and conforms with Government specifications for Grade "B" water pipe.

Anaconda 85* Red Brass Pipe is offered as the highest quality corrosion resistant water pipe obtainable at moderate cost. It is recommended for use under such highly corrosive conditions as are imposed by mechanically filtered waters which are relatively low in hardness, high in carbonic acid gas content and low in alkalinity; ground waters from shallow artesian wells or large dug wells and colored water from peaty sources. This pipe is also recommended for rigid underground lines and salt water service. Anaconda 85 Red Brass Pipe contains 85% copper, is semi-annealed, seamless and conforms with Government specifications for Grade "A" water pipe.

Anaconda Copper Pipe is available for those who prefer to use pure copper pipe to meet highly corrosive water conditions. It is of the same high quality that characterizes Anaconda Brass Pipe.

Descriptive literature and prices furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA
COPPER WATER TUBES

For Plumbing, Heating and Gas Lines

The American Brass Company offers Anaconda Copper Water Tubes for underground service and also for interior plumbing where low cost is the influencing factor.

Within comparatively recent years, copper tubes have been used with entire success for underground water service lines, suction and return lines connecting oil burners with fuel tanks, fire and lawn sprinkler systems, domestic gas lines, low pressure heating lines, air conditioning and industrial and residential plumbing.

Anaconda Copper Water Tubes are furnished both hard and soft and in two classes as to wall thickness.

Type K, the heavier tube, complies with U. S. Government Specification WW-T-799 or A.S.T.M. Specification B-88-33 for Type K tubes. This class of tubes is recommended for underground service and general plumbing.

Type L tubes meet the requirements of the same government specifications for Type L tubes and are suitable for interior plumbing.

All Anaconda Copper Water Tubes are drawn to the accurate dimensions required for use with standard solder or flared tube fittings and conform with **U. S. Government and A.S.T.M. Specifications.**

As a safeguard against substitution and to afford permanent identification, the name ANACONDA is stamped in the metal at intervals throughout each straight length and coil of Copper Water Tube.

Descriptive literature and prices furnished upon request.

ANACONDA FITTINGS

CAST BRONZE AND WROUGHT COPPER

For Assembling Anaconda Copper Water Tubes

The American Brass Company offers a complete line of Anaconda Fittings of three distinct types for assembling Copper Water Tubes:

(a) Cast Bronze Flared Tube Fittings, in all sizes from ⅛ in. to and including 2 in.

(b) Cast Bronze Solder Fittings, in all sizes from ¼ in. to 6 in. inclusive.

(c) Wrought Copper Solder Fittings, in all sizes from ⅜ in. to 2 in. inclusive, including Seamless Tees.

Anaconda fittings are precision-made to assure tight connections and an unrestricted flow. For permanent identification, the Anaconda trade-mark is cast or stamped in every fitting.

Anaconda Flared Tube Fittings in conjunction with soft Anaconda Copper Water Tubes, have a definite field of application, particularly for fire sprinkler systems and underground lines such as water and domestic gas services, oil burner assembly and supply lines, etc.

Anaconda Cast Bronze Solder Fittings make it possible to assemble Copper Water Tubes with sound, leak-proof joints for water, gas and oil lines; also low pressure steam and air installations. All standard reductions and standard pipe threads are provided for in Anaconda Cast Bronze Solder Fittings.

Anaconda Wrought Copper Solder Fittings possess high tensile strength with complete elimination of porosity which makes them particularly suitable for lines carrying refrigerants such as Freon, Sulphur Dioxide, Methyl Chloride, and other penetrating fluids and certain thin gases. The wrought fittings heat at the same rate as the copper tube, making perfect solder connections which are stronger than the tube itself. Through the use of adapters, all combinations of connections are possible with these fittings.

Accessories

For the convenience of users of Anaconda Copper Water Tubes and Fittings, The American Brass Company is prepared to furnish spooled solder wire (95% tin—5% antimony); "Nokorode" soldering paste; Anaconda copper tube straps and Anaconda sizing and flanging tools.

Descriptive literature and prices furnished upon request.

ANACONDA THROUGH-WALL FLASHINGS

Anaconda Through-Wall Flashings are made of 16 ounce Anaconda Copper, either plain or lead coated, in strips five feet long, with a zigzag pattern of ridges embossed in two widths for either 8 in. or 12 in. walls. These ridges, which prevent lateral movement are $\frac{7}{32}$ in. high and so designed that water which accumulates in the wall will be shed outwardly or in the desired direction.

Anaconda Flashings are supplied in three Standard Types and in Special Forms as follows: Type A is for use where a flashing flush with the faces of the wall is desired. Type B has a plain $4\frac{1}{4}$ in. selvage on the drain side of the flashing. Type C for Spandrel and Lintel flashing, has a 2 in. selvage on the dam side, and is made for a 12 in. wall only.

Special Anaconda Through-Wall Flashings are made to order with a variable selvage up to 4 in. on the dam side, and with a variable selvage on the drain side up to an over all flashing width of 25 in.

Through the planned efficiency of design and the variety of sizes and shapes available, Anaconda Flashings supply a definite need for a product that can be used on the less expensive class of buildings. The patented design provides for an effective bond with the mortar and offers resistance to lateral movements of the wall which may be caused by vibration, ice, a sloping bed or slime produced by lime in the mortar.

An advantage to the sheet metal worker and to the mason lies in the simplicity of the design and the ease of application. Anaconda Flashings can be bent and cut to fit on the job by the contractor. Tight end joints can be made by overlapping one corrugation. Interior and exterior angles at corners may be flashed by butting or slightly lapping the adjoining sheets. Where specified, solder is easily applied to the flat ends or edges of the flashing. Another practical advantage of this flashing is that the strips nest together so that, when carried in stock they occupy very little more space than plain sheets. This feature also facilitates transportation and handling.

Descriptive literature and prices furnished upon request.

EVERDUR*

Strong as Steel; Durable as Copper

Everdur is Copper scientifically alloyed with Silicon and other elements to make it as strong as steel. The standard Everdur alloy possesses the strength and toughness of medium carbon steel and resistance to a somewhat wider range of corroding agents than copper. It is readily weldable by both gas and electric methods, and for other fabricating operations is worked by substantially the same methods and equipment used with steel.

In addition to the standard wrought Everdur, there are a number of modified alloys, one of which has free-cutting qualities.

As an engineering and structural material, its balanced combination of physical, chemical and fabricating properties, have made it possible for Everdur to replace other materials, not only with initial economy, but providing more efficient service and longer life.

Among its many applications are hot water tanks, chemical process vessels, brew kettles, air conditioning equipment, sewage disposal and waterworks equipment, boat fastenings, circuit breaker domes, pump shafting, cast valves and fittings, acid sludge lines, heat exchanger equipment, cable clips and pole line hardware, etc.

Everdur is produced exclusively by The American Brass Company in the forms of plates, sheets, wire, rods, pipe and tube, hot pressed parts, forging blanks, casting ingots and welding rods. It is available in fabricated form from experienced manufacturers.

Descriptive literature and prices furnished upon request.

*Trade-mark Reg. U. S. Pat. Off.

BERYLLIUM COPPER

This recently developed Anaconda metal is pure Copper alloyed with Beryllium and Nickel. Because it readily responds to precipitation hardening, Beryllium Copper can be cold worked and heat treated to obtain higher physical values than those of any other non-ferrous metal.

The most valuable feature of this alloy is that it can be worked and formed in the soft annealed state, and its physical properties afterwards greatly increased by heat treatment. Soft annealed alloy with a tensile strength of about 70,000 p.s.i. can be improved by cold working and heat treatment to any desired strength up to 200,000 p.s.i., with Rockwell of C-41, or G-104 hardness, Brinell of 360 or more, and a fatigue limit well above 40,000 p.s.i. These properties remain stable at ordinary temperatures.

The fatigue resistance of Beryllium Copper has been demonstrated in an extensive vibration test. The sample tested was $1\frac{5}{8}$ in. long, .013 in. thick, $\frac{3}{8}$ in. wide at one end, tapering to $\frac{3}{16}$ in. at the other. The vibrator was operated at a rate of 230 cycles per second, the full movement of the deflection being $\frac{1}{16}$ in. Each reversal involved a stress of 20,000 pounds. After two billion reversals, no signs of fracture due to fatigue were present.

The electrical conductivity of Beryllium Copper is high compared with that of steel, phosphor bronze and other high-strength materials. Both electrical and thermal conductivities of Beryllium Copper are improved by heat treatment.

Beryllium Copper is produced by The American Brass Company in the forms of sheets, wire, rods, tubes, and within certain limitations, die pressed parts.

Descriptive literature and prices furnished upon request.

AMBRAC*

Ambrac is the trade name of a corrosion resisting white metal introduced and manufactured exclusively by The American Brass Company.

Because of its ability to withstand the action of alkalis, hot gases, dilute acids and saline solutions, it has been used with exceptional success for mine screens, salt works tubes and condenser tubes. It is suitable for engineering purposes where high resistance to corrosion and maximum strength combined with easy working qualities are desired.

Unlike many alloys exploited for similar purposes, it is not refractory but can be drawn, spun, stamped or double seamed with ease.

When annealed, Ambrac has a tensile strength of approximately 50,000 pounds per square inch and an elongation of about 35% in two inches. This tensile strength can be increased to 110,000 pounds per square inch, or even higher by cold working. The elongation would be correspondingly reduced to about 1.5% in two inches.

Ambrac is supplied in wrought forms and casting ingots.

AMBRALOY

Ambraloy is used generically to define all Aluminum Brass and Aluminum Bronze Alloys manufactured by The American Brass Company. These include both standard and special alloys produced in various forms, a number of which respond to precipitation hardening or heat treatment. Ambraloy is used extensively for condenser tubes, where it meets the requirements in price and service durability of an intermediate grade between Admiralty and the Nickel Alloys.

Avialite* another Aluminum Bronze Alloy is designed especially for use in the aviation field as a valve seat material. Through its physical properties, it closely responds to the coefficient of expansion of Aluminum Alloy cylinder heads. It will withstand long and fast flights without being affected by the hammering or "peening" of the valves and does not become pitted from carbon as do iron and steel.

Descriptive literature and prices furnished upon request.

*Trade-mark Reg. U. S. Pat. Off.

OTHER ANACONDA PRODUCTS

WIRE FOR WEAVING INTO CLOTH

Copper, Fourdrinier, Phosphor Bronze, Ambrac,* Antique and Golden Bronze.

SPECIAL WIRE PRODUCTS

Brake Lining Wire. Preformed wire for well screen construction. Fancy Shaped Wire in a variety of designs. Nickel Silver Resistance Wire. Fine wire on spools.

NICKEL SILVER

For flatware, spoon, knife and fork handle stock. Key stock, knife bolster stock. Slide fastener stock.

SHEET AND PLATE PRODUCTS

Mine Screen Plates. Cold Rolled Phosphor Bronze Bridge Plates. Rolled plates for Perforated Grilles. Polished and Patent Leveled Sheets. Engravers, and Etching Brass. Printers' Rules.

TURBINE BLADING, CAULKING AND PACKING STRIPS

Copper, "70 & 30" Brass, Manganese Copper, Cupro Nickel-20%, Monel Metal, Pure Nickel and Stainless Iron.

PLATERS' BARS AND CORES
COPPER AND CUPRO NICKEL PROJECTILE BANDS

Further information and prices furnished upon request.

*Trade-mark Reg. U. S. Pat. Off.

"HOLTITE"* BRAZING SOLDER

Twenty-five years' experience in producing Brazing Solder has developed a wide range of alloys which are carefully granulated to meet any specification as to size required for various uses, including the manufacture of the following: Automobiles, Bicycles and Motorcycles, Brass and Steel Buttons, Sugar Apparatus and Acid Stills, Copper Work for Marine purposes, Jewelry and small Metal Wares, Brazed Brass and Steel Tubes.

LIST OF STANDARD GRADES

Giving Numbers, Grains, Sizes, Colors and Melting Temperatures.

ANACONDA METALS FOR BOATS

Tobin Bronze* propeller shafting was used in the original naphtha launch built by Gas and Engine Power Co. in 1885. Since that date Tobin Bronze and other Anaconda metals have been standard materials in the construction of motor boats, yachts and sailing craft. Today the great majority of standard motor boats and cruisers are equipped with either Tobin Bronze or Tempaloy shafts and are fastened with Everdur Metal. All America's Cup Defenders, with one exception, from "Vigilant" (1893) to "Rainbow," 1934 defender, have had Tobin Bronze hulls. "Miss America IX" and "Miss America X," are fastened with Everdur screws.

Combining high resistance to salt water corrosion with light weight, ductility and tortional strength comparable to steel, Tobin Bronze is an ideal metal for marine duty. In addition to hull plates and propeller shafting, Tobin Bronze is used for fin keels, centerboards, rudders, skegs and other underwater parts.

Tempaloy* is a new high-strength, heat-treatable copper alloy, which is furnished in the form of shafting for high-speed and heavy duty boats where maximum strength and toughness as well as light weight are essential.

Everdur* has become the most widely used fastening material for boats. It is also used for welded gasoline tanks, bulkheads and underwater parts.

Ambrac*—Cast and wrought hardware.

Nickel Silver—Cut-waters, mouldings, hardware, etc.

Brass and Bronze—Hardware, trim, cables, etc.

Copper and 85 Red Brass Pipe—For plumbing and exhaust pipes.

Copper Water Tubes and Fittings—For plumbing and fuel lines.

Special Extruded and Drawn Shapes—For mouldings, trim, sail tracks, bindings, etc.

Descriptive literature and prices furnished upon request.

*Trade-marks Reg. U. S. Pat. Off.

ANACONDA METALS FOR TEXTILE MILLS

For years Anaconda Metals have been serving economically and efficiently as textile equipment materials. Anaconda engineers have solved many problems and developed many standard Anaconda materials which are used for textile mill service, including the following:

Copper Printing Rollers

Furnished in three types—Solid, Duplex and Built-Up. Anaconda Rollers are accurate in dimension, uniform in hardness and meet all requirements for machining, burnishing, polishing, pantagraphing and etching. They are particularly free from porosity. All rolls are fabricated from Anaconda High Conductivity Copper.

The Duplex and Built-Up types are exclusive Anaconda developments. They combine the efficiency of solid rolls with considerable savings in weight and cost.

Seamless Copper and Everdur Tubes for Dry Cans

These tubes, which are free from brazed seams, are produced by cold drawing through dies, which provides exceptionally high strength, stiffness and smoothness of surface. They are round and straight, and are furnished in special diameters for dry can service.

Everdur*

Everdur Metal is copper alloyed with other elements to obtain the strength and weldability of steel. It is immune to rust and highly resistant to a wide variety of corroding agents.

Leading manufacturers of textile equipment can furnish welded tanks, vats, kettles, buckets, dippers, extractor baskets, bleaching and dyeing equipment, hoods, kiers, cast valves, fittings, linings, etc., made of Everdur.

Further information and prices furnished upon request.

*Trade-mark Reg. U. S. Pat. Off.

ANACONDA METALS FOR TEXTILE MILLS

Ambrac*

Ambrac is a high strength, corrosion resistant alloy composed principally of copper and nickel. It is available in both cast and wrought forms for textile equipment. Unlike most high strength white metal alloys, Ambrac is not refractory and is worked almost as easily as brass.

Brass Pipe and Copper Water Tubes

Anaconda Seamless Brass Pipe for use with threaded fittings is made in two alloys,—67 Yellow Brass Pipe for use under normal corrosion conditions, and 85 Red Brass Pipe, which is considered the most durable brass pipe produced commercially.

Anaconda Copper Water Tubes are used extensively for plumbing and carrying lines. Anaconda Fittings, for assembling the tubes, are furnished in both solder and flared tube types.

Other Products

Anaconda Copper, Brass, Bronze and Special Copper Alloys in the forms of sheets, wire, rods and seamless tubes are in service in multiple applications in textile mills, such as linings for tubes and size boxes, copper covered squeeze rolls, miscellaneous rollers, facings for rotary press beds, spirals for cloth openers, traveler rings, humidifying equipment, loom and spinning equipment, bushings and bearings, spreader bars, hydro-extractor baskets, pails, dippers, etc.

Anaconda Die Pressed Parts, Pressure Die Castings, Extruded, Drawn and Rolled Special Shapes and irregularly formed Seamless Tubes are used to improve quality and effect economies in the design and construction of textile machinery.

Further information and prices furnished upon request.

*Trade-mark Reg. U. S. Pat. Off.

ANACONDA PRODUCTS FOR PULP AND PAPER MILLS

For years Anaconda Copper and Copper Alloys have been used to solve corrosion and mechanical problems in pulp and paper mills; in many instances through the development of special metals to provide combinations of qualities not obtainable in standard materials.

Among the special Anaconda Products and Metals used extensively in the pulp and paper industries are:

Phosphor Bronze and special alloy wire for weaving into Fourdrinier screens.

Yellow Brass and Red Brass Tubes specially fabricated for Fourdrinier rolls.

Phosphor Bronze and other special alloy Jordan and Beater Bars.

Copper, Brass and Everdur for "Save-All" pans.

Copper Alloy Welding Rods for gas and electric welding.

Large diameter, cold drawn, Seamless Copper Tubes for conveying "white water" and pulp.

Everdur is used in a wide variety of applications where high strength and high corrosion resistance are required of a material that is as flexible as steel from a structural standpoint. Everdur "Save-All" pans, fabricated by welding, have replaced pans made from other materials, not only with initial economy, but with service life several times that of the pans replaced.

Anaconda Brass Pipe for use with threaded fittings, is manufactured in two alloys—67 Yellow Brass for use under normally corrosive conditions, and 85 Red Brass, considered the most durable brass pipe available.

Anaconda Copper Water Tubes are furnished in both straight lengths and coils for use with Anaconda solder or flared type fittings.

Special Products

Anaconda Die Pressed Forgings, Pressure Die Castings, Special Extruded and Drawn Shapes, and irregularly formed Seamless Tubes are used to replace sand castings for many paper mill machinery parts. They are free from blow holes or other imperfections, have a higher tensile strength and require very little, if any, machining.

Further information and prices furnished upon request.

FRENCH SMALL TUBE BRANCH

The French Small Tube Branch, as manufacturers of a completely diversified selection of small diameter and thin gauge Copper, Brass, Bronze, Nickel Silver and Aluminum Tubes, occupies a most unique position in its own field. Its products are used by innumerable industries and professions and range from commercial sizes used in connection with the equipment of automobiles, refrigerators and oil burners to minute special shapes used in assembling intricate surgical instruments and delicate recording equipment.

Standard manufacturing limitations for French tubes are from 1 in. O.D. to fifteen one-thousandths of an inch O.D. and a five-thousandths of an inch hole. French Tubes are produced not only in cylindrical form, but also in square, rectangular, hexagonal, fluted and other special and irregular cross sections. One of the specialties of this branch is Bourdon Tube, in all wall thicknesses down to .003 inch.

Through the development of a new process, the French Small Tube Branch is equipped to furnish cold drawn Seamless Tubes in lengths never before produced except by splicing. These long length coils of solid tubes, produced from a single piece of stock, vary in length from 109 ft. for $\frac{5}{8}$ in. O.D. tube to 1,000 ft. for $\frac{1}{8}$ in. O.D. tube. Smaller sizes can be drawn correspondingly longer because limitations of length are based on the size of the initial tube stock.

Long length coils have been found particularly advantageous in the installation of central unit refrigerating systems where they have been suspended on hangers, bent around obstructions and threaded through walls, eliminating the time and cost of making numerous joints, and providing greater security because a one piece tube reduces the possibility of leakage. These long length tubes are also used to advantage for oil burner installations and offer economies in the fabrication of parts requiring shorter sections because the amount of scrap is greatly reduced over that resulting when standard mill lengths are used.

Further information and prices furnished upon request.

AMERICAN METAL HOSE BRANCH

American Flexible Hose is manufactured in a number of patterns and can be furnished in any workable metal. The pattern to be used depends on the service for which it is intended. For the general run of services a high tensile strength, non-rusting bronze or a special galvanized steel is used.

While applicable to any hose service, American Flexible Metal Hose and Tubing is designed to withstand severe service and for applications where chemical action, intense heat or extreme pressures tend to limit the life of any other kind of hose.

Bronze Steam Hose: For normal services and pressures BD15 unbraided interlocked hose is usually recommended. Where constant flexing, high pressures, or rough handling is unavoidable, type BD20 braided steam hose is preferable because of its greater strength. Both of these types are corrosion-resisting, and easily withstand the effects of moisture, heat and high pressures. Where steam is to be superheated, galvanized steel hose is recommended in preference to bronze. Packed I P T couplings are threaded onto the profile of the hose. Common uses: boiler tube blowing, heating tank cars, hydraulic connections and any other purpose where high temperature moisture and corrosion tend to shorten the life or limit the use of other types of hose. Made in sizes ⅛ in. to 8 in. inclusive.

Oil Hose: Similar to BD15 and BD20 Bronze except that it is made from a special galvanized steel and the couplings are usually soldered on. Common uses: flexible lubrication lines; unloading tank cars; conveying tar, asphalt and grease.

Heater Tubing: A four-walled light weight tubing made from metal .010 to .012 thick is admirably adapted to the conveying of hot air to the carburetor on automobiles, airplanes, tractors, etc. Also, used as protective armor for electric wiring, flexible connections on dusting machines, air-conductors on hair-drying equipment, dust conveyors, and many other uses where a light, dependable tubing is needed for services not involving liquids or high pressures.

Descriptive literature and prices furnished upon request.

AMERICAN METAL HOSE BRANCH

Seamless Flexible Tubing: Made from one solid continuous piece of metal into which are pressed deep helical or annular convolutions to impart the necessary flexibility. It has no seams, welds, laps, joints nor packing, and is absolutely leakproof and seep-proof. This tubing is unusually flexible and its popularity has become widespread for such uses as conveying Ammonia or Sulphur Dioxide gas, for conveying illuminating gas, oil and gasoline lines, hydraulic feeds and speed mechanisms on machine tools.

When protected with a double wire braiding and equipped with heatproof couplings, American Seamless is listed by the National Board of Fire Underwriters as standard equipment for fuel lines on Oil Burners.

Movable Platen Press Connections: A patented Brass Bracket Support holds the flexible seamless tubing constantly in a horizontal position thus eliminating the formation of water pockets. Since flexing is equalized, the movement is controlled within well-defined limits without concentration of bending. Uses: to convey steam, or steam and cold water alternately to the platens on molding and plastic presses.

Gas Holder Heating Hose: Made in two styles—A and B. Style A is made up of an inner core of BD15 Flexible Bronze Interlocked Tubing over which is applied a quarter inch layer of asbestos rope and an outside covering of either bronze wire or weatherproofed cotton jacket. Style B has an additional layer of bronze lacing immediately over the inside core giving added strength.

Other Products: In addition to the above, the American Metal Hose Branch of The American Brass Company manufactures square locked flexible metal conduit for casings and protective armor; also flexible metal tubing for gasoline hose, vacuum cleaner hose, exhaust hose, brass lamp arms and a variety of other types. The Technical Department, with over 25 years' experience, will gladly cooperate in the solution of flexible hose and tubing problems.

Descriptive literature and prices furnished upon request.

WATERBURY BRASS GOODS BRANCH

The Waterbury Brass Goods Branch manufactures an almost infinite variety of metal parts from Copper, Brass, Bronze, Nickel Silver and special alloys. It possesses the largest assortment of tools for eyelets available in this country.

Through wide experience in the design of complicated metal parts and batteries of the most modern automatic machines, this branch is in a position to offer worthwhile economies in the development and manufacture of fabricated metal products. Its engineers and designers are always available to customers for consultation on materials, design and manufacture.

Following is a listing of departments producing standard products:

Tru-Flange* Eyelets—Largest selection of stock eyelets manufactured in America.

Grommets—Standard sizes carried in stock. Special styles made to order.

Cups and Shells—All shapes and sizes finished or unfinished, such as clock cases, speedometer cases, vacuum bottle cases, fire extinguisher shells, soap boxes, vanity cases, etc.

Blanks and Stampings—Of every description, such as watch blanks and washers made from heavy and light metal.

"Star"* Fasteners—"Star" and "Griptite"* paper and sample fasteners, loop fasteners, shanks, staples, suspension rings and braces and many other small brass and wire novelties.

Electrical and Radio—Screw shells, fuse caps, ferrules and clips, terminals, push button and receptacle plates. Vacuum tube base pins and electrodes.

Ferrules—For desk and chair legs, pipes, tool handles of all description, cutlery handles, pencils, etc.

"Holtite"* Brazing Solder—Supplied at short notice for all classes of brazing.

Finishing—Finishing departments are large and well equipped, producing all the standard and special finishes.

Descriptive literature and prices furnished upon request.

40	.0031	.1366	.1437	.1411	.1375

To determine the weight of sheets for other alloys—

Multiply the above weights for Nickel Silver as follows:

10% Nickel Silver-752	15% Nickel Silver-739	20% or 30% Ambrac
.9905	.9937	1.0127

Multiply the above weights for Yellow Brass as follows:

Tobin Bronze	5% Phosphor Bronze-351
.9935	1.0458

Variations from these weights must be expected in practice.

To determine the weight of Wire for other alloys, multiply the above weights for Yellow Brass by the following factors:

Red Brass-80%	Commercial Bronze-90%	5% Phosphor Bronze-351
1.0262	1.0426	1.0492

Variations from these weights must be expected in practice.

3/4	1.696	2.160	2	12.06	15.36

Sizes = Diameters or distances between parallel faces.

To determine the weight of a Hexagon or Octagon Rod, multiply weight of a Round Rod of equal diameter by:

1.1027 for Hexagon 1.0548 for Octagon

To determine the weight of Rods for other alloys, multiply the above weights by the following factors:

5% Phosphor Bronze-979 (Leaded) 1.0063
8% Phosphor Bronze-353 ..... .9938
10% Phosphor Bronze-354 ..... .9906

Weights for 5% Phosphor Bronze-351 are same as for Phosphor Bronze-610.

Variations from these weights must be expected in practice.

1 9/16	7.087	7.815	9.023
1 5/8	7.665	8.452	9.760

Sizes = Diameters or distances between parallel faces.

To determine the weight of Octagon Rods multiply weight of a Round Rod of equal diameter by 1.0548.

Weights for Everdur-1012 are the same as for Everdur-1010.

To determine the weight of Everdur-1015 Rods, multiply the above weights by the following factor:

Everdur-1015
1.0260

Variations from these weights must be expected in practice.

EVERDUR-1010 RODS

ANACONDA YELLOW BRASS RODS

Pounds Per Thousand Pieces

The weight tables given on the following pages have been prepared to assist the Estimator on Screw Machine Products in determining the theoretical weights of rod stock required for a given job.

Weights are shown for various diameters and in lengths of from 1/16" to 2" inclusive and give the amount of stock required, in pounds per 1,000 pieces, with no allowance made for cutting. By adding the width of the saw cut to the length, the total weight may be obtained.

Although the figures given in the tables cover theoretical weights for Anaconda Free Cutting Yellow Brass Rods only, factors are given for adjusting these weights to other commercial alloys. Additional factors for unlisted alloys will be furnished upon request.

To determine the weight of other than Yellow Brass Rods, multiply the weight appearing in subsequent pages by the factors shown below:

Leaded Alloys

Leaded Tobin Bronze	.9902
Leaded Naval Brass	.9902
Leaded 10% Nickel Silver-823	.9967
Leaded 12% Nickel Silver-796	1.0228
Leaded 18% Nickel Silver-789	1.0326
Everdur-1012	1.0033
Hardware Bronze-267	1.0326
Leaded Commercial Bronze-202	1.0391
Phosphor Bronze-610 (Special Free Cutting)	1.0423
Leaded 5% Phosphor Bronze-979	1.0489
Leaded Copper-946	1.0521

Non-Leaded Alloys

Tobin Bronze	.9902
Naval Brass	.9902
Everdur-1010	1.0033
18% Nickel Silver-719	1.0293
Commercial Bronze-90%	1.0358
Copper	1.0489

To find the weight of Hexagon, Octagon and Square Rods, multiply the weight of a Round Rod of the same diameter by:

Hexagon—1.1027 **Octagon—1.0548** **Square—1.2732**

SEAMLESS TUBE CONVERSION FACTORS

Alloys

To determine the weight of Seamless Tubes of the following alloys, multiply the weights of Yellow Brass Tubes by factors shown below:

Red Brass-80%	-1.0195	Muntz Metal	- .9967
Red Brass-85%	-1.0293	Ambraloy-901	- .9609
Commercial Bronze-90%	-1.0358	Ambraloy-927	- .9805
Ambrac-850	-1.0423	Admiralty	-1.0033
Phosphor Bronze-351	-1.0423	Everdur-1015	-1.0293
		"70 & 30" Brass	-1.0033

Super-Nickel Tubes—use same weight as for Copper Tubes

Diameters

To determine the weight of a Tube of a given I.D., add the following Constants to the weights for O.D. Tubes appearing in subsequent pages.

Stubs' Gauge

Thickness		Constants		Thickness		Constants	
Gauge	Inches	Brass	Copper	Gauge	Inches	Brass	Copper
	.375	3.26	3.42	17	.058	.078	.082
	.328	2.49	2.62	18	.049	.056	.058
1	.300	2.08	2.19	19	.042	.0408	.0430
2	.284	1.87	1.96	20	.035	.0284	.0298
3	.259	1.55	1.63	21	.032	.0237	.0249
4	.238	1.31	1.38	22	.028	.0181	.0191
5	.220	1.12	1.18	23	.025	.0145	.0152
6	.203	.95	1.00	24	.022	.0112	.0118

8	.165	.630	.663	26	.018	.0075	.0079
	.156	.563	.593	27	.016	.0059	.0062
9	.148	.507	.533	28	.014	.0045	.0048
10	.134	.416	.437	29	.013	.0039	.0041
	.125	.362	.381	30	.012	.0033	.0035
11	.120	.333	.351	31	.010	.0023	.0024
12	.109	.275	.289	32	.009	.0019	.0020
13	.095	.209	.220	33	.008	.0015	.0016
14	.083	.159	.168	34	.007	.0011	.0012
15	.072	.120	.126	35	.005	.0006	.0006
16	.065	.098	.103	36	.004	.0004	.0004

General Formulas

To determine the weight in pounds per linear foot of a Seamless Tube size not shown on pages 103-119.

1. When O.D. is given:
   Subtract gauge from O.D.
   Multiply by gauge
   Multiply by—
   11.5736 for Brass
   12.1768 for Copper

2. When I.D. is given:
   Add gauge to I.D.
   Multiply by gauge
   Multiply by—
   11.5736 for Brass
   12.1768 for Copper

The above factors are arrived at by using a density of .307 pounds per cubic inch for Yellow Brass and .323 pounds per cubic inch for Deoxidized Copper.

General Formulas

To determine the weight in pounds per linear foot of a Seamless Tube size not shown in the foregoing tables:

1. When O.D. is given:
   Subtract gauge from O.D.
   Multiply by gauge
   Multiply by—
   11.5736 for Brass
   12.1768 for Copper

2. When I.D. is given:
   Add gauge to I.D.
   Multiply by gauge
   Multiply by—
   11.5736 for Brass
   12.1768 for Copper

The above factors are arrived at by using a density of .307 pounds per cubic inch for Yellow Brass and .323 pounds per cubic inch for Deoxidized Copper.

COPPER WATER TUBES

Pounds Per Linear Foot

EXPANSION OF METALS BY HEAT

The coefficient of linear expansion of a body is the rate at which the unit of length changes, under constant pressure, with an increase of unit or one degree of temperature; the coefficient of expansion for areas is, approximately, two times, and the coefficient of cubical expansion three times the coefficient of linear expansion. A bar, if not fixed, undergoes a change in length $= ltn$, where l is the length of the bar, t the number of degrees, n the corresponding linear coefficient.

To find the increase of a bar due to an increase in temperature, multiply the length of the bar by the increase in degrees and by the coefficient from the table.

COEFFICIENTS OF LINEAR EXPANSION BETWEEN ROOM TEMPERATURE AND 100°C (212°F)

Metal	per °C	per °F
Aluminum	0.0000238	0.0000132
Brass (85% Cu)—Cold Drawn	.0000177	.0000098
Brass (75% Cu)—Cold Drawn	.0000184	.0000102
Brass (65% Cu)—Cold Drawn	.0000190	.0000105
Bronze (4.2% Sn)—Cold Drawn	.0000173	.0000096
Copper	.0000168	.0000094
Everdur-1010	.0000170	.0000094
Gold	.0000143	.0000079
Iron, cast gray (3.1%C, 1.7%Si)	.0000084	.0000047
Iron, electrolytic	.0000120	.0000067
Lead	.0000291	.0000162
Magnesium	.0000260	.0000144
Nickel	.0000133	.0000074
Platinum	.0000090	.0000050
Silver	.0000191	.0000106
Steels	.0000111 to .0000124	.0000062 to .0000069
Tin[1]	.0000270	.0000150
Zinc[1], cast	.0000395	.0000219

[1] Anisotropic; coefficient of expansion varies with different samples.

Variations from these values must be expected in practice.

HEAT CONDUCTIVITY OF METALS AND ALLOYS AT 18°C

The heat conductivity k of a material is the quantity of heat in small calories which is transmitted per second through a plate one centimeter thick per square centimeter of its surface when the difference of temperature between the two faces of the plate is one degree Centigrade. The column k_{18} in the table below gives the conductivity at 18° C. and the units are calories per square centimeter per centimeter per second per degree Centigrade. The value of k is found to vary with the temperature of the plate and the column a is the temperature coefficient of thermal conductivity per degree Centigrade at 18° C. The temperature coefficient a is fairly accurate for the approximate range from −50° C. to 200° C. and the conductivity at any temperature t in this range is given by the equation:

$$k_t = k_{18}[1 + a(t - 18)]$$

The values for conductivity can be converted to the ordinary engineering units by the following factors:

Units	Factors by which Cal./sq.Cm./Cm./Sec./°C. Should be Multiplied to Convert to the Desired Units
Watts/sq. cm./cm./°C.	4.186
BTU/sq. ft./in./sec./°F.	0.8064
BTU/sq. ft./in./hour/°F.	2903.
BTU/sq. ft./ft./hour/°F.	241.9

Metal	k_{18}	a
Aluminum	0.514	+0.0002
Brass, Yellow	0.285	+0.0010
Red Brass—85%	0.380	+0.0013
Copper	0.923	−0.000041
Iron (Pure)	0.170	−0.0008
Lead	0.083	−0.00057
Nickel (Pure)	0.217	−0.0010
Nickel (Commercial Malleable)	0.167	−0.0007
Tin	0.154	−0.00069
Zinc	0.275	−0.0003

Variations from these values must be expected in practice.

RESISTIVITY OF METALS AND ALLOYS AT 20° C

The resistivities are the values of p in the equation $R=pl/s$, where R is the resistance in microhms of a length l *cm.* of uniform cross section s cm^2. The temperature coefficient is a_{20} in the formula $R_t=R_{20}\,[1+a_{20}(t-20)]$.

Metal	Resistivity in Microhm Centimeters	Temperature Coefficient at 20°C.	Electrical Conductivity Compared with Annealed Copper as 100.0
Aluminum	2.828	.0039	61.0
Beryllium Copper Soft or Hard Drawn	10.0 ±	.....	17 ±
Beryllium Copper Heat treated	6.8-9.8	.....	18-25
Brass (65% Cu)	6.4	.....	26.8
Copper (Annealed)	1.7241	.00393	100.0
Copper (Hard Drawn)	1.77	.00382	97.4
Everdur-1010	25.8	.00034	6.7
Iron (99.98%)	9.78	.....	17.6
Lead	20.8	.0039	8.3
Nickel	7.3	.006	23.6
Nickel Silver (18%Ni)	31.4	.00033	5.5
Tin	11.5	.0042	15.0
Zinc	5.9	.0037	29.2

Variations from these values must be expected in practice.

RULES RELATIVE TO THE CIRCLE

Hexagon and Octagon

To Find the Radius:

Multiply the diameter by		.50000	Log.	$= \bar{1}.69897$
Or " " circumference by		.15915	"	$= \bar{1}.20182$
" " " sq. root of the area by		.56419	"	$= \bar{1}.75143$

To Find the Diameter:

Multiply the radius by		2.00000	Log.	$= 0.30103$
Or " " circumference by		0.31831	"	$= \bar{1}.50285$
" " " sq. root of the area by		1.1284	"	$= 0.05246$

To Find the Circumference:

Multiply the radius by		6.2832	Log.	$= 0.79818$
Or " " diameter by		3.1416	"	$= 0.49715$
" " " sq. root of the area by		3.5449	"	$= 0.54960$

To Find the Area:

Multiply the sq. of the radius by		3.1416	Log.	$= 0.49715$
Or " " " " " diameter by		0.78540	"	$= \bar{1}.89509$
" " " " " "circumference by		0.079577	"	$= \bar{2}.90079$

To Find the Area of a Hexagon:

Multiply the sq. of the distance between flats by		0.86603	Log.	$= \bar{1}.93753$
Or multiply the area of the inscribed circle by		1.1027	"	$= 0.04244$

To Find the Area of an Octagon:

Multiply the sq. of the distance between flats by		0.82843	Log.	$= \bar{1}.91825$
Or multiply the area of the inscribed circle by		1.0548	"	$= 0.02316$

1 U. S. Gallon of water weighs 8.34523 Pounds Avoirdupois at 4° C.

CONVERSION TABLES

Weights and Measures

All tabular values containing less than 6 places of figures are constants. Thus, 1 meter = exactly 39.37 U. S. Inches.

Metric System

The "meter" is the metric unit of length; the "gram," of weight or mass; and the "liter," of capacity. All other metric units are the decimal subdivisions or multiples of these units, and are formed by adding the following prefixes to the words meter, gram, and liter. The meanings are as indicated.

milli-	= .001 of unit	deka-	= 10. times unit
centi-	= .01 of unit	hecto-	= 100. times unit
deci-	= .1 of unit	kilo-	= 1000. times unit

Thus, centimeter = .01 meter; kilogram = 1000. grams; etc.

For all practical purposes 1 cubic decimeter equals 1 liter and 1 liter of water weighs 1 kilogram; but the tables herewith are based on the more accurate relationship that 1 liter = 1000.027 cubic centimeters.

United States-Metric

Basic Standards

1 meter = 39.37 inches.

1 liter = volume of 1 kilogram of pure water at its maximum density (at a temperature of 4°C, practically) and under the standard atmospheric pressure (of 760 millimeters of mercury).
= 1.000027 cubic decimeters (= 1000.027 cubic centimeters).

1 avoirdupois pound = 453.5924277 grams.

1 gallon = 231. cubic inches.

Equivalents

$\pi = 3.14159265$	$3\pi = 9.42478$	$\frac{1}{\pi} = 0.318310$	$\sqrt{2} = 1.41421$
$\frac{\pi}{4} = 0.785398$	$12\pi = 37.6991$	$\frac{4}{\pi} = 1.27324$	$\sqrt{3} = 1.73205$

Note—The small subnumeral on the opposite page following a zero indicates that the zero is to be taken that number of times; thus: $.0_5188$ is equivalent to .00000188 and 188160_3 is equivalent to 18816000.

1 kilogram per square millimeter =
1422.34 pounds per square inch.

1 pound per cubic inch = 27.6797 grams per cubic centimeter.

1 gram per cubic centimeter = 0.0361275 pound per cubic inch.

CONVERSION TABLES

United States-British
Basic Standards

The United States-British conversion factors given below are derived from the United States-Metric and the British-Metric factors. The basic factors used are:

1 meter = 39.370113 British inches.

1 British gallon = 4.5459631 liters.

1 British pound = 0.45359243 kilogram.

(Note: The U. S. pound to 8 places is also equal to 0.45359243 kilogram)

Conversion Factors—United States-British

Unit	Relationship	
	United States	British
Length	1 Inch	= 1.0000029 Inches
	0.99999713 Inch	= 1 Inch
Area	1 Square Inch	= 1.0000057 Square Inches
	0.99999426 Square Inch	= 1 Square Inch
Volume	1 Cubic Inch	= 1.0000086 Cubic Inches
	0.99999140 Cubic Inch	= 1 Cubic Inch
Capacity—Liquid	1 Gallon	= 0.8326799 Gallon
	1.2009416 Gallons	= 1 Gallon
Mass	1.0000000 Pound	= 1.0000000 Pound

Miscellaneous Equivalents—United States—British

1 U.S. mile =
1760. U.S. yards = 5280. U.S. feet = 63360. U.S. inches.

1 Brit. mile =
1760. Brit. yards = 5280. Brit. feet = 63360. Brit. inches.

1 U.S. gallon =
4. U.S. quarts = 8. U.S. pints = 32. U.S. gills = 128. U.S. fluid ounces.

1 Brit. gallon =
4. Brit. quarts = 8. Brit. pints = 32. Brit. gills = 160. Brit. fluid ounces.

1 U.S. short ton =
20. U.S. short hundredweight = 2000. U.S. pounds.

1 U.S. long ton =
20. U.S. long hundredweight = 2240. U.S. pounds.

1 Brit. ton =
20. Brit. hundredweight = 2240. Brit. pounds.

TEMPERATURE TABLES

The column in bold face refers to the given temperature either in degrees Centigrade or Fahrenheit. The equivalent will be the corresponding figure in the column to which the conversion is being made.

Variations must be expected in practice.
a For some alloys the figures given are for a temper slightly different from that commonly known as "Hard".
b Determination.
e Elongation of wire, percent in ten inches.
g Yield point taken as the load producing an extension under stress of 0.75%.
k At 18.1° C.
m Cold worked and heat treated.
p Annealed, quenched and heat treated.
v Smith constitution diagram.
† Soft. *per °C. from −50 to +50 °C.

ANACONDA ALLOYS

CHEMICAL AND PHYSICAL PROPERTIES

(See Data Shown In This Folder)

The values given are, in most cases, for "Hard" Rolled or Drawn Metal, and for "Soft Annealed" Metal, and represent averages that may be expected in commercial practice.

Higher values for Tensile Strength, Yield Point, Elastic Limit, and Hardness may be obtained by a greater amount of working, and, in the same manner, figures between those shown for "Hard" and "Soft" may be obtained by a lesser amount of working than that used to obtain "Hard" Temper.

IMPORTANT

Because of manufacturing limitations which may, in some cases, alter the values, it must be understood that the properties shown in these tables are not to be used for specification purposes, but should be considered only as a general guide. Our Technical Department is, however, prepared to supply specific information for individual conditions, providing it has full details regarding dimensions, applications, etc.
